# TRANSURBAN INSIGHTS: ELECTRIC VEHICL

February 2024

Transurban Insights reports use data and research from our business, as well as surveys we commission, to explore specific issues relevant to road transport. We share these insights with government and industry and use them to inform driver and community education campaigns.

In this edition of Transurban Insights we examine current levels of hybrid and electric vehicle ownership, and barriers to adoption. We also explore the impact different incentives would have on electric vehicles uptake.

# Availability and price

Incentives

Electric vehicles will play a key role in tackling greenhouse gas emissions over the coming decades, and new research shows that many Australians and North Americans are considering purchasing an electric vehicle as their next car.

Road transport generates around 12% of global greenhouse gas emissions.<sup>2</sup> Most of these emissions come from the fossil fuels burned to power vehicles. Low and zero emission vehicles – such as hybrids and electric vehicles - have the potential to minimise road travel's environmental impacts as well as improving air and noise pollution.

A survey of 1,682 people across Australia and North America, commissioned by Transurban, found that ownership of hybrid and electric vehicles in the cities surveyed is low (between 13% to 15%) (Figure 1), but the number of people who would like for their next car to be an electric vehicle is much higher at 40% in the Australian cities surveyed, and 35% in Montreal and the

1,682 respondents aged 18+ with a driver licence from: Brisbane, Melbourne and Sydney (Australia); the Greater Washington Area, covering Virginia and Maryland (United States); and Montreal (Canada)<sup>1</sup>

Survey commissioned by Transurban and conducted by Nature

Online survey conducted in mid-2023

Greater Washington Area.<sup>3</sup> These people were also more likely (between 53% and 57%) to buy an electric vehicle as their next car (Figure 2).

Of those who would like their next car to be an electric vehicle, most expect to buy their next car within three years (Figure 3). And of those who are likely to buy an electric vehicle as their next vehicle, most want a sports utility vehicle (SUV), (Figure 6).

In 2021, we found 42% would like their next car to be an electric vehicle, but high purchase cost, lack of charging infrastructure and concern around how much it would cost to charge were holding them back. Our research found these concerns still persist (Figure 7). Lower cost of electricity to charge at home or work, more public electric vehicle charging stations and government incentives when buying a new electric vehicle (e.g., cash back schemes) would incentivise those considering taking the plunge into electric vehicle ownership (Figure 6).

<sup>3</sup> Figures calculated by multiplying % of respondents who rated 'desire to purchase' between 3-5 and intention to purchase between 4-5

# \_=Transurban

<sup>&</sup>lt;sup>1</sup> More than 300 respondents from each Australian city, the United States and Canada

<sup>&</sup>lt;sup>2</sup> Hannah Ritchie, 2020, Our World in Data: <u>Sector by sector: where do global greenhouse gas emissions come from?</u>, accessed November 2023

#### **Key findings:**

**40% of respondents in the Australian cities surveyed** would like for their next car to be an electric vehicle, compared to 35% in the Greater Washington Area and Montreal

**Sports utility vehicles** (SUVs) are the most preferred vehicle model

Australians spend on average \$39,857 on new SUVs, much less than the cheapest electric SUVs on the market which start at \$44,400 Most people in the Australian cities surveyed would be willing to pay somewhere between \$20,000 to \$79,000 for an electric vehicle

**Most people in the Greater Washington Area and Montreal** would be willing to pay somewhere between USD/CAD20,000 to 59,000 for an electric vehicle

**Cheaper electricity** at home or work, more public charging and lower cost models would help incentivise electric vehicle ownership

Only showing responses of those who intend to purchase an EV as their next vehicle. Q. When do you intend to buy your next vehicle?

# Availability and price

Electric vehicles are becoming increasingly popular. In Australia, 8.1% of new car sales in 2023 were electric, up from just 3.8% in 2022 (Figure 5). In 2020, electric vehicle sales accounted for 0.78% of car sales in Australia, compared to 4.2% globally.<sup>1</sup> A similar adoption rate has been seen in the US, with electric vehicle sales rising in the US from 2.3% in 2020 to around 9% in 2023.<sup>2</sup>

SUVs have become the most popular model of vehicle sold in Australia (Figure 4). In 2013 they made up around 16% of new car sales, but now they account for more than half of all new car sales.<sup>3</sup> SUVs and their larger counterpart the pickup truck, which is similar to an Australian ute, are also popular in the US and Canada.

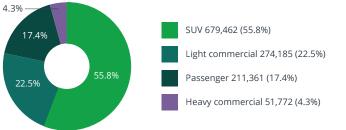

Because SUVs are bigger and heavier than sedans they tend to use more fuel and emit more greenhouse gases. It has been reported that their rapid rise in popularity has effectively wiped out the climate gains from electric vehicles.<sup>4</sup> Given most people plan to buy a new car within three years, with most likely to choose an SUV, it's critical that consumers are provided with affordable electric options.

The August 2021 edition of our Urban Mobility Trends report found that high purchase price was the number one barrier to adoption in the Australian cities surveyed. In this survey we explored how much people would pay for an electric vehicle and found most people in the Australian cities surveyed would be willing to pay somewhere between \$20,000 to \$79,000, in the Greater Washington Area and Montreal most people would be willing to pay between USD/ CAD20,000 to 59,000 (Figure 7).

- Vehicle Council, February 2024
- <sup>8</sup> Canstar Blue research, September 2023

In 2023, there were 91 models of electric vehicles available in Australia,<sup>4</sup> compared to 50 available in the US,<sup>5</sup> and 84 in Canada.<sup>6</sup> As it stands, there are 29 fully electric SUV models available in Australia, priced from \$44,400 (for the BYD Atto 3) and \$239,000 (for the Lotus Electre).<sup>8</sup> The median price of an electric SUV in Australia is around \$85,000.<sup>9</sup> This is much higher than the price people generally spend on new cars, with Australians spending an average \$37,362 on new cars and \$39,857 on new SUVs.<sup>9</sup>

\$120,000 and above	2%	12%	3%

Australia Greater Washington Area Montreal

Prices are in local dollars, respectively: Australian Dollar, United States Dollar, and Canadian Dollar.

Q. What is the maximum price you would be willing to pay for an electric vehicle of any type?

The survey also tested the relative impact different incentives would have on uptake of electric vehicles. It found a range of factors would help increase uptake, however lower electricity costs to charge vehicles at home was rated as impactful by the most respondents in the Australian cities surveyed and the Greater Washington Area. In Montreal, government incentives for new vehicles (e.g. cash back) were rated as impactful by the most respondents (Figure 8).

While zero-emissions vehicles are generally more expensive than their petrol-fuelled counterparts, they are much cheaper to run. Infrastructure Partnerships Australia has calculated that when price parity is achieved, which could be as early as 2025, owners of zero-emission vehicles will save at least \$3,600 over an eight-year lifespan even after their hypothetical road-user charge of four cents per kilometre is applied.<sup>1</sup>

In Australia, government incentives are available however they vary between states, including rebates, stamp duty exemptions and registration discounts.

In Victoria, a decision by the High Court to repeal the state road-user charge for electric vehicles is expected to prevent other states from pursuing plans to introduce road user charges on electric vehicles – creating an opportunity for the Federal Government to consider broader road user funding reform. A similar national approach could be taken with electric vehicle incentives, with this research finding that people would be most incentivised by cheaper home electricity, access to more charging infrastructure and more affordable electric vehicle models (Figure 8).

Research from the Electric Vehicle Council found that approximately 90% of Tesla owners surveyed reported using public chargers less than once a week and these vehicles were being driven as far as petrol or diesel vehicles – highlighting that driving range isn't a major barrier for existing owners.<sup>2</sup> Despite this, availability of charging infrastructure is still a major concern for between 11% and 16% of those surveyed (Figure 9).

This shows there is more still to do to educate consumers on the practical benefits of electric vehicles, which is why we have rolled out a range of initiatives to highlight the benefits of electric vehicles, and address misconceptions around them, to our more than 10 million customers. This includes incentives such vehicle giveaways, an industry event for fleet managers and customer experience program. Around 10% of Transurban's fleet is electric or hybrid, and in 2023 we deployed an electric incident response vehicle – the first of its kind in Australia.

Read more about our electric vehicle initiatives <u>on our website</u>.

Figure 8: (Of those who would like for their next car to be an electric vehicle) What would incentivise people who are considering buying an electric vehicle – Australia, GWA, Montreal

	Australia	Greater Washington Area	Montreal
Government incentives for new electric vehicles (eg cash-back)	15%	12%	20%
Lower cost of electricity to charge the vehicle at home or work	16%	16%	15%
Guarantees on battery performance or used vehicle	10%	12%	14%
Low interest rate loans to purchase a new or used electric vehicle (eg green financing options)	9%	13%	12%
More public electric vehicle charging stations	16%	13%	12%
Incentives for electric vehicle running costs (eg rebates on road tolls, discounted parking, lower registration fees)	13%	14%	11%
Government incentives for second-hand electric vehicles	10%	9%	10%
Access to a wider variety of electric vehicle models	11%	11%	8%
Australia 📕 Greater Washington Area	Montreal		

Only asked of those who expressed a desire to purchase an electric vehicle.

Q. Thinking about your decision to buy a new or second-hand/used electric vehicle, please distribute 100 points across each of the statements shown below based on their impact on your decision making. Please give more points to those statements most impactful and fewer or no points to those less impactful statements, ensuring your answers total 100.

## Figure 9: (Of those who would like for their next car to be an electric vehicle) What is stopping you from buying a new or used electric vehicle – Australia, GWA, Montreal

	Australia	Greater Washington Area	Montreal
Higher purchase price for electric vehicles in general	27%	20%	26%
Long wait times for electric vehicle orders	7%	8%	13%
Lack of residential charging infrastructure (E.g.: can't charge at home or can't install charger at home)	12%	16%	11%
Long charge time	8%	12%	11%
Lack of convenient public charging infrastructure	13%	15%	10%
High cost of at-home charging	11%	10%	9%
Lack of available brands and models	7%	9%	7%
Currently available models aren't powerful enough for my needs	5%	6%	7%
Too much effort to switch to an electric vehicle	5%	5%	6%
The electric vehicle charge for every kilometre you drive, instead of fuel excise that would cost you more per kilometre	6%		

📕 Australia 📕 Greater Washington Area 📕 Montreal

Only asked of those who expressed a desire to purchase an electric vehicle.

Q. Thinking now about the things stopping you from buying a new or second-hand/used electric vehicle, please distribute 100 points across each of the barriers shown below based on their impact on your decision making. Please give more points to those statements that represent the biggest barriers and fewer or no points to those statements that represent the smallest barriers, ensuring your answers total 100.
